Project Summary & Business Insights

1K	98	0.10	28	5
Total Records	Total Incidents	Incident Rate %	Critical Incidents	Open_Incidents

Key Findings

- The dataset contains 1,000 IT system monitoring records.
- 98 IT incidents were detected.
- The incident rate is approximately 9.80%.
- High CPU usage, response time, error count, network latency and anomaly score are important risk indicators.
- Production and high-usage systems require stronger monitoring.
- Open and critical incidents need faster resolution and preventive action.

Business Recommendations

- Monitor high-risk servers continuously.
- Set automatic alerts for high anomaly scores.
- Prioritize critical and open incidents.
- Schedule preventive maintenance for risky servers.
- Use CPU, memory, disk, response time and error count as early-warning indicators.
- Review departments and server types with high incident rates.

Final Conclusion

The AI-Powered IT Incident Prediction & Prevention System helps IT teams understand system behavior, identify high-risk infrastructure and take proactive action before failures become major outages.

The Power BI dashboard provides clear visibility into incident trends, severity, server performance, environment risk, maintenance status and operational reliability.

This project supports faster decision-making, reduced downtime and
